

After Treatment Care

Do

Soothe + Sterilize

Use witch hazel, diluted tea tree oil, or aloe vera to soothe & sterilize the area.

Reduce Inflammation

Apply a cold compress to minimize swelling.

Schedule Your Next Appointment

Make sure you get the time-slot that works best for your lifestyle.

RECOMMENDED

Managing Pain + Discomfort

Apply a topical salve or aloe vera

Take a pain relief tablet (use as directed).

Apply a numbing cream containing Lidocaine that can be found over the counter or you can get one slightly stronger that can be prescribed by a physician.

Sun + Swim

Stay out of the sun for 72-hours to avoid pigment spots. If you will be in the sun, be sure to use a sunscreen with a minimum of 30-SPF.

Avoid chlorine for 48-hrs.

DONT

Increase Risk of Infection

Avoid rubbing, scratching, and over-touching the treated area within the first 24-hours post-treatment.

Alcohol Based Products

Refrain from using products like perfume immediately following treatment. Isopropyl alcohol burns and can irritate the treated area because the pores are open.

Remove Scabs

It's normal for scabs to form after electrolysis so it's important to never pick them. Removing a scab prematurely can cause scars and increase chances of infection.

Wax, Tweeze, Thread or Sugar

If you must remove your hair between appointments, then shave, clip or use a depilatory cream.

Remember, if you bleach in between appointments, make sure there is enough time for your hair to grow back in so your electrologist can see your roots {approx 1/16" to 1/8"}.

Sweat Excessively

Engagement in activities that cause excessive sweating, like working-out or sitting in a sauna, immediately after treatment can trigger a build-up of bacteria and cause infection.

WHAT TO EXPECT

Redness, Swelling, Scabbing + Possible Bruising

The post-treatment sensation feels similar to a sunburn. You may apply witch hazel or aloe but ask your electrologist about other post-treatment options that may be appropriate for you.
